

ISO 27001

Irell & Manella LLP has achieved ISO 27001:2013 Certification, the most widely adopted information security standard in the world and the highest level of security-related accreditation a business can achieve. The firm achieved this certification for all of its offices and data centers.

ISO 27001 is an internationally recognized security standard that specifies the establishment, maintenance, and continuous improvement of an organization's information security management system. These stringent standards exist to ensure that formal security and risk management controls are in place to protect the confidentiality, integrity, and availability of sensitive company, client, and personal information. The rigorous certification process requires annual audits to ensure that the firm is using state-of-the-art practices and procedures to secure its clients' sensitive data and to keep pace with the ever-changing cybersecurity landscape.

Irell's ISO certification was achieved after a rigorous three-year process of risk assessment, evaluation, and process implementation, which included both an internal and independent audit process.
